There are many methods that can be used to calculate the porosity, the user may use density log, sonic log, neutron log, or combination between them, but the most common one is neutron-density log combination.

quality control on the data and determine what corrections are required before carrying out quantitative analysis of the data. For example, gas, fractures and lack of compaction require corrections to be applied to the sonic log. Lithologies affect the density, neutron and sonic logs.

Perhaps the best way to begin a study of logging is by introducing the reader to some of the basic concepts of well log analysis. Remember that a borehole represents a dynamic system; that fluid used in the drilling of a well affects the rock surrounding the borehole and, therefore, log measurements. In addition, the rock

Well-logs are single point measurements of physical properties of the subsurface recorded in a well and vary vertically with depth. The properties are random and aperiodic and depend on factors like mineral composition or lithology, porosity, cementation and compaction, presence of fluids etc.,
