## **Protein Protein Interactions And Networks**

Protein-protein interaction (PPI) networks describe physical interactions between proteins, taking place to mediate the assembly of proteins into protein complexes, or e.g., mediating signaling/regulation and transport

events in the cell. Genetic interaction (GI) networks deal with pairs of proteins for which there is information that they interact functionally (i.e., the absence or presence of both proteins has a synergetic effect on the cell physiology/phenotype).

However, the protein-protein interaction (PPI) network is a nonlinear and complex model and cannot depend on single biological evidence. Hence, it is necessary to represent the PPI network by using Naïve Bayesian model which could integrate disparate data into an advantageous platform.

Valium, one of the best known antianxiety drugs, produces its calming effects by binding with a particular protein in the brain. But the drug has an almost equally strong affinity for a completely different protein.

Understanding this secondary interaction might offer clues about Valium's side effects and point the way
